

## ABSTRACT OF THE DISCLOSURE

A method of transferring facility information by radio in which the user uses a radio communication device (for example, cellular telephone) to connect to a control center through a base station, requesting the control center to transfer the information of facilities in the area around the location of the radio communication device. The computer system of the control center has a facility information database from which the control center searches the desired facility information subject to the target of the location of the base station or the location of the radio communication device.
